

About the 2019 Agronomy Day

Sharpening the pencil to analyze the cost of crop production is more important than ever with commodity prices at or below production costs. Plan to spend the day learning about which agronomic practices have the greatest probability for a profitable return.

Learn about advances made to help manage white mold, herbicide resistant weeds, starter fertilizers, soybean seed treatments and more.

Lastly, marketing and risk management need to be a major focus. Have your marketing plans and pricing objectives been determined? What marketing tools may help you reach your price targets? What are corn and soybean ending stocks telling us about supply and demand and prices for 2019?

Thanks to our industry sponsors for their support of this educational program.

Plan to attend an informative and enjoyable day.
